

## Get Started with Lunon

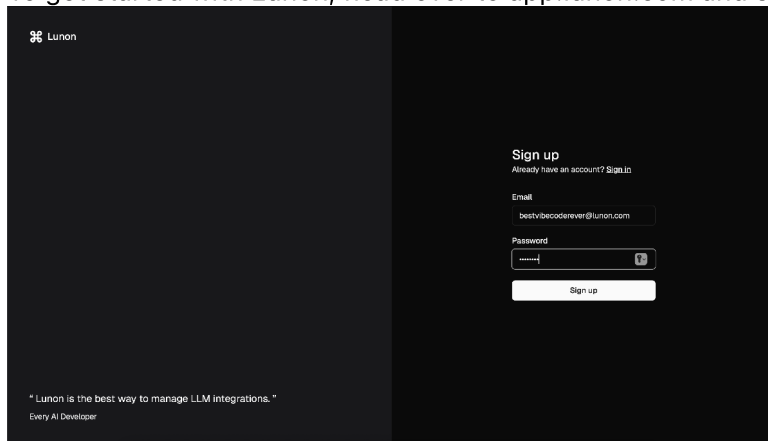

Welcome to Lunon. Lunon makes it easy to add AI to your applications as well as swap and test different models. We're really excited to see what you build!

### General Housekeeping

We've worked hard to make building applications with Lunon *really simple*. However there's a few housekeeping things that you might need to build insanely great things like signing up with credits or support etc.

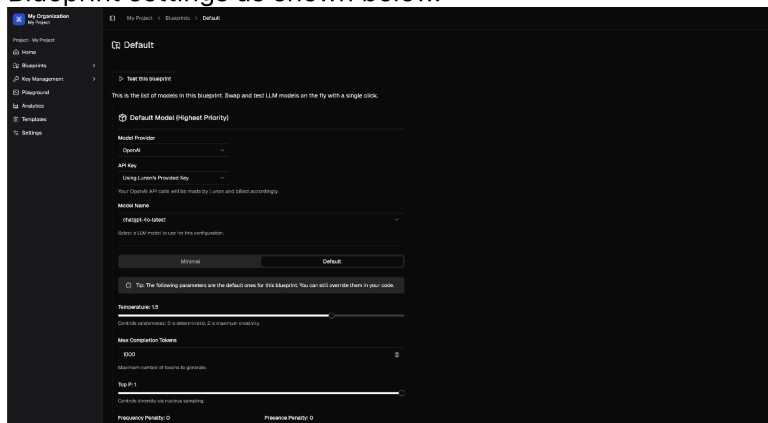

## 1. Sign Up for a Lunon Account

To get started with Lunon, head over to [app.lunon.com](https://app.lunon.com) and sign up with a free account.

## 2. Add and configure your application

Then, follow the on-screen instructions to add Lunon to your codebase. You can configure things like the behavior of your project by clicking the dropdown and then selecting Default. This blueprint (which is also the main "model" parameter in your code) is used to route your requests to your selected LLM in the Blueprint settings as shown below.

Next, fill out the form provided in the Discord to automatically get credits applied to your account. We're offering **\$10 free credits** for the duration of your project. We think that this will go a really long way into the future!
